April 22nd, 2026

Description:

A web application that can allow users to locate parks within the Seattle area and find parks with certain amenities and features.

The application will allow users to analyze and visualize what parks are available to them and give them access to search, filter and find public parks that suit their needs, such as parks with basketball courts, bathrooms, soccer fields, etc...

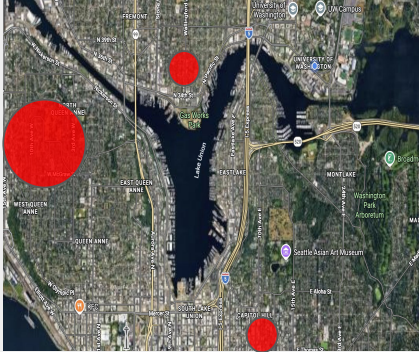

Current data:

Relevant data is available through Seattle's public data portal, which allows for data analysis when given matching park IDs. This isn't accessible for regular users and other park maps do not recognize or focus on amenity features, but general park information such as boundary lines and names.

With two datasets, one that gives general information about parks (Address, ID, names) and another dataset associating with features/amenities. The main idea is to combine the datasets and make an accessible app to let users discover parks and their features around them.

Description of main concepts

Columns (8) General Park Data			
Column Name	Description	API Field Name	Data Type
# PMAID		pmaid	Number
# LocID		locid	Number
Tt Name		name	Text
Tt Address		address	Text
Tt ZIP Code		zip_code	Text
# X Coord		x_coord	Number
# Y Coord		y_coord	Number
📍 Location 1		location_1	Location

Columns (3) Park Amenities (Based on PMAID)			
Column Name	Description	API Field Name	Data Type
# Service Layer ID		service_layer_id	Number
Tt feature desc		feature_desc	Text
Tt PMAID		pmaid	Text

Basic Architecture for System

1. Data visualizations using Python and hosted on streamlit
2. Add in filtering capabilities to look for parks within a range or certain amenities
3. Future plans to make a mobile application for users to use with their geolocation data
